OBJECTS IN JAVASCRIPT

2022H1 OSE (Kasper, Shokoofeh)

What is an Object

- An advance structure which help to encapsulate the related data and behavior of an entity.

- Any entity in a real world can be implemented in Js as an object:
  - The properties of the entity maps to the corresponding variables,
  - The behavior of the entity maps to a function (so called method).
    - Behaviors are actions that can be performed on objects and their properties.

Suggest some properties and methods for this object:

CAR

Properties

Model
plateNumber
Owner
Year
Speed
GearNumber

Methods

brake
accelerating
setOwner
setPlateNumber
changeGear

Suggest some properties and methods for this object:

Student

Properties

name
family
yearOfBirth
branch
address

Methods

showinfo
getAge
fullName

Suggest some objects!!

Course

country

Teacher

Laptop

Book

shape

Building

Plant

Chair

Weather

Define a country object in JS

```
var population = 5501043;
var countryName = "Finland";
```

```
var myCountry = {
        name: "Finland",
        population: 5501043
};
```

Object literal

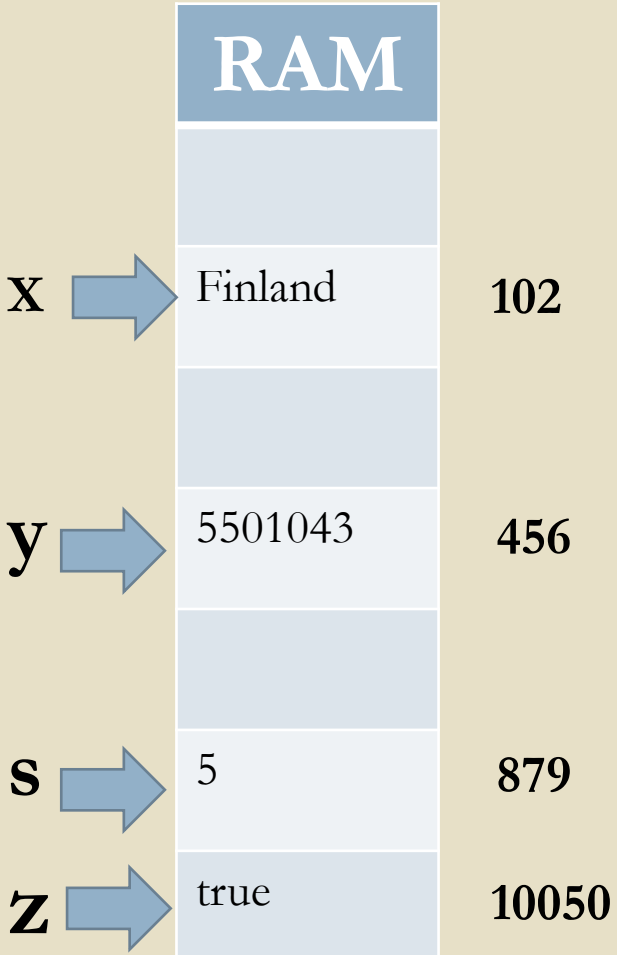
primitive variables vs reference variables

Primitive variables:

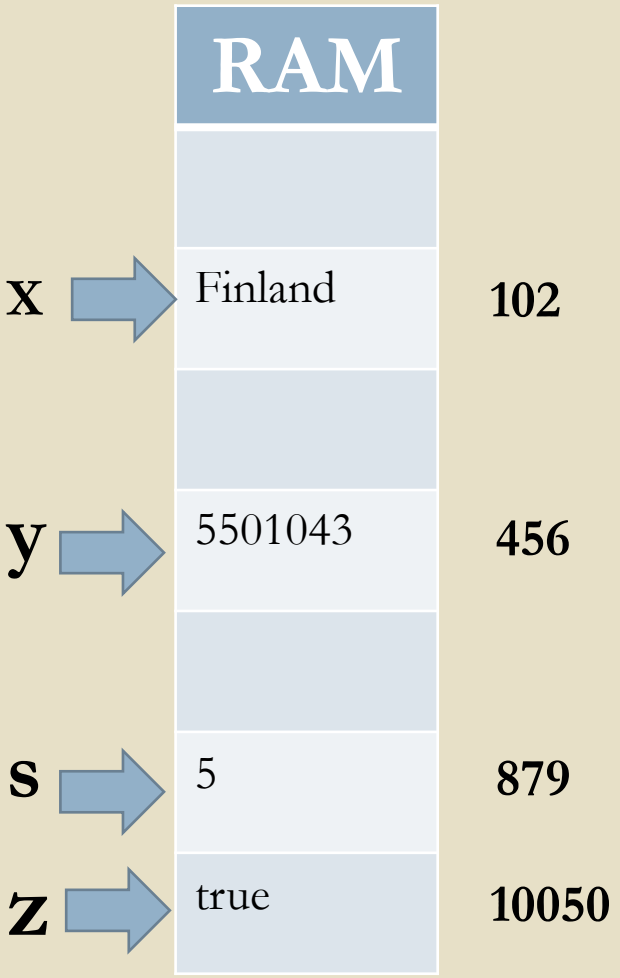
- String var x = "Finland";
- Numbers

  var y = 5501043;

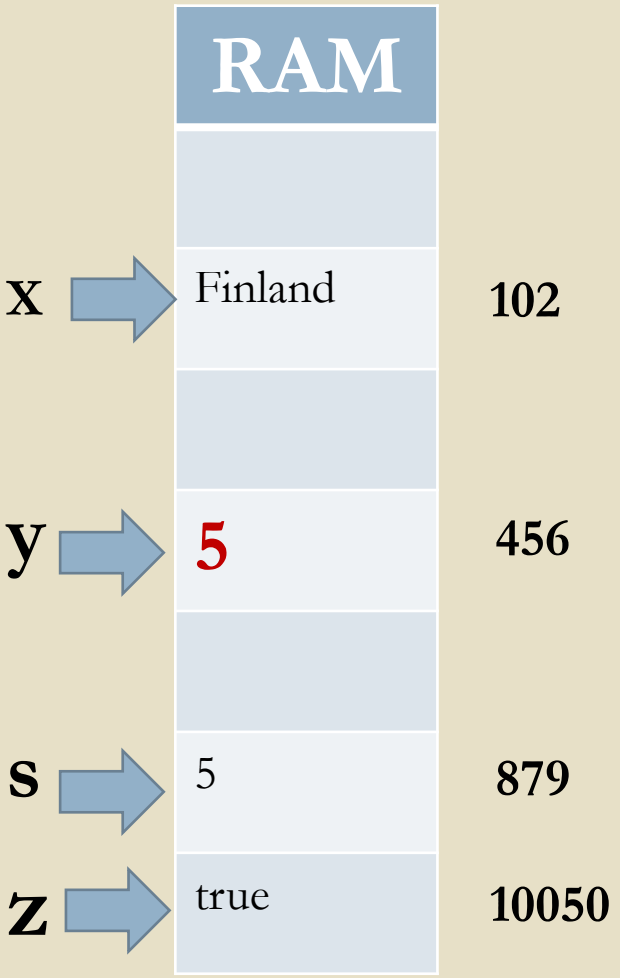
  var s=5;
- Boolean var z = true;



primitive variables vs reference variables



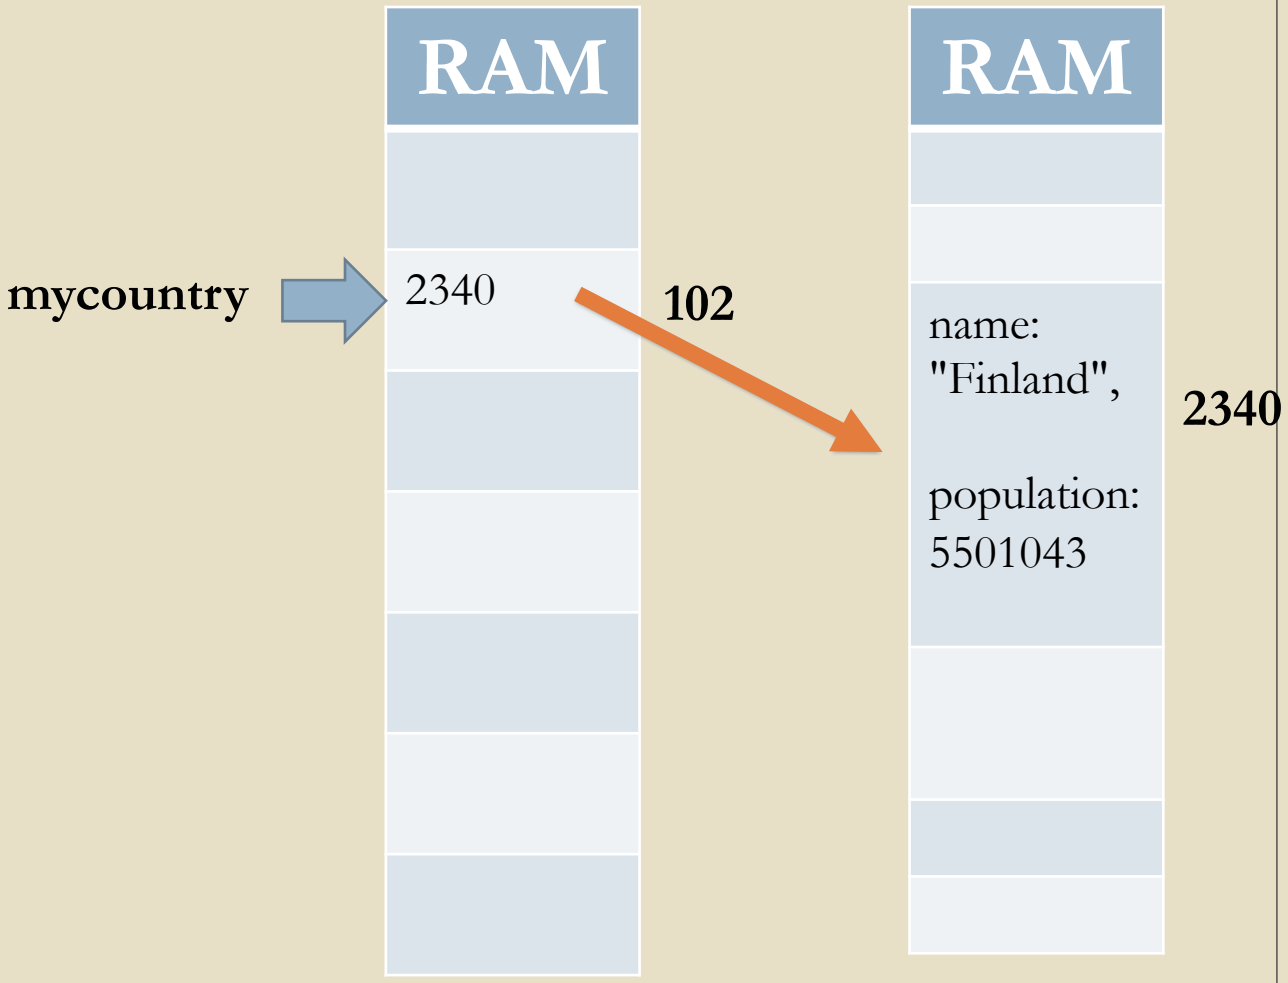
y= s;

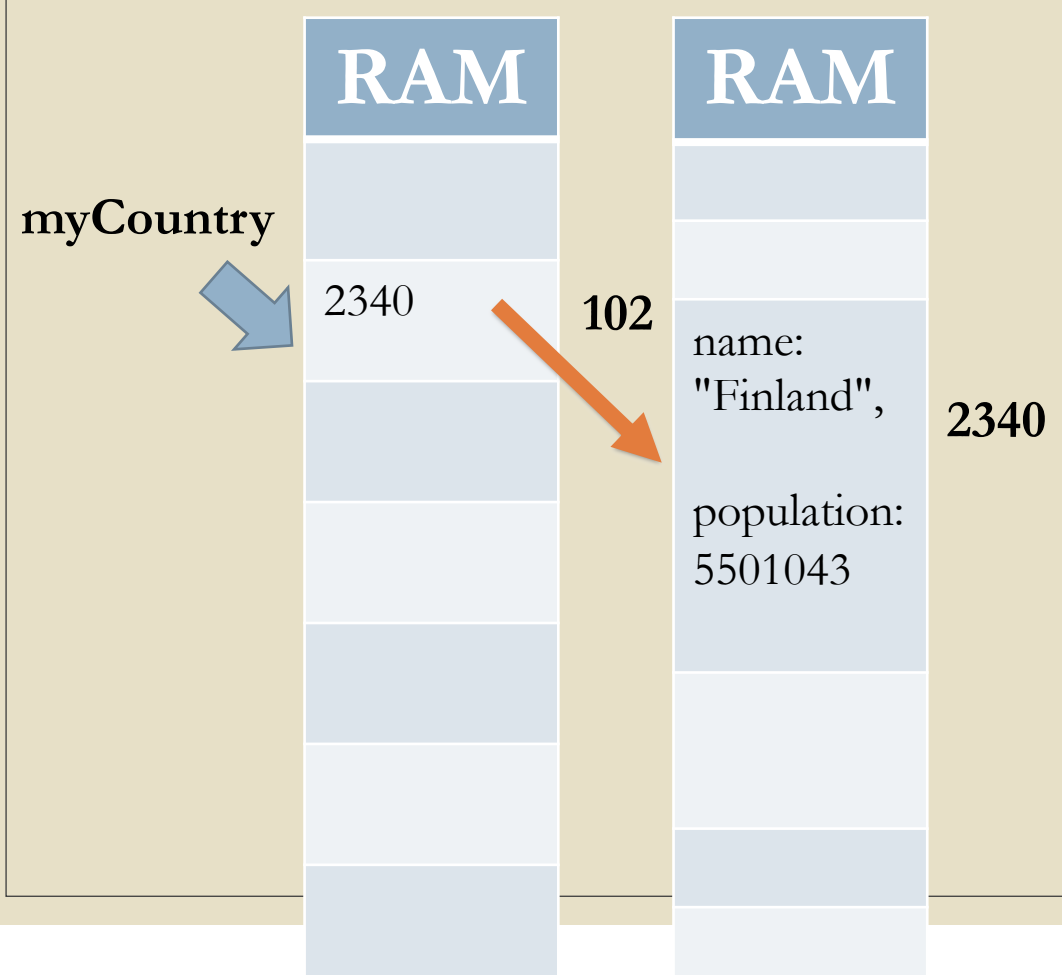


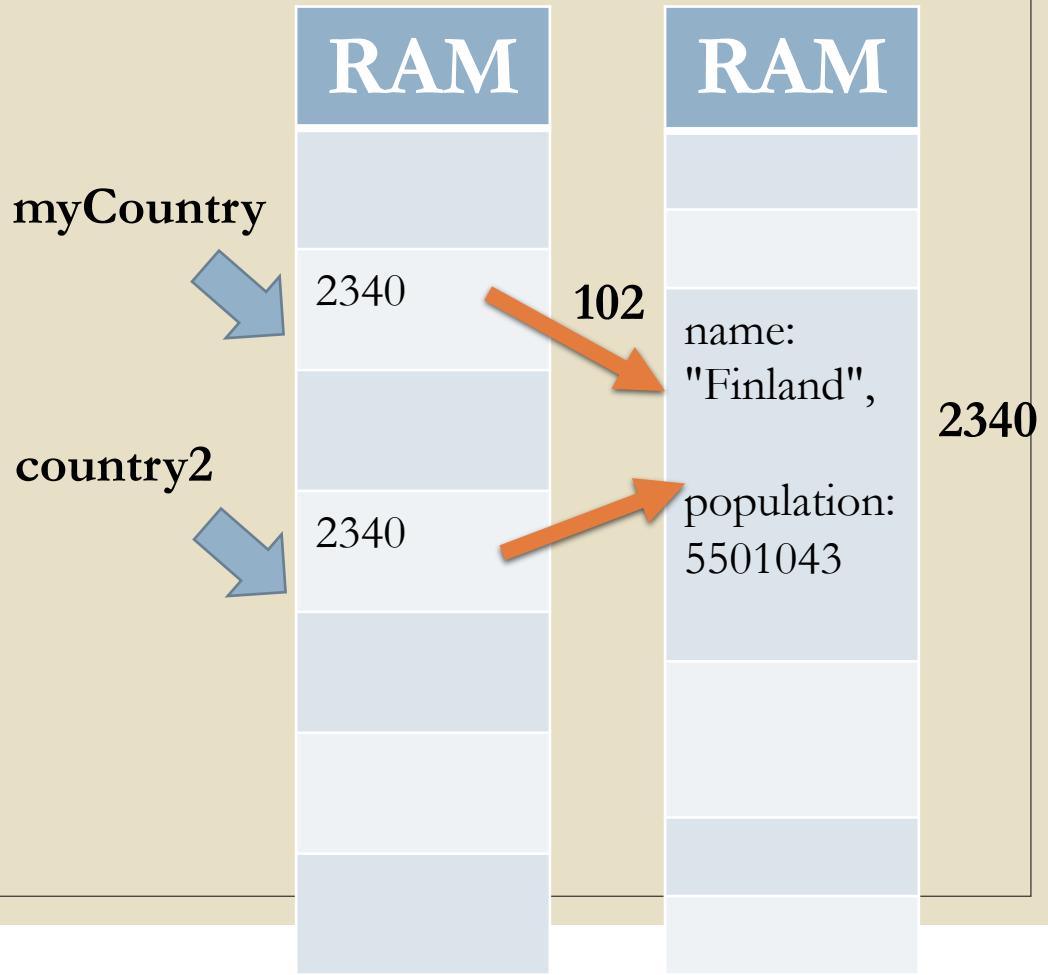
primitive variables vs reference variables

Reference variables

```
var myCountry = {
    name: "Finland",
    population: 5501043
};
```



primitive variables vs reference variables




var Country2 = myCountry
