JavaScript basics

Reading from an input field, writing to an HTML page, assignment statement, calculation, and formatting a decimal number.

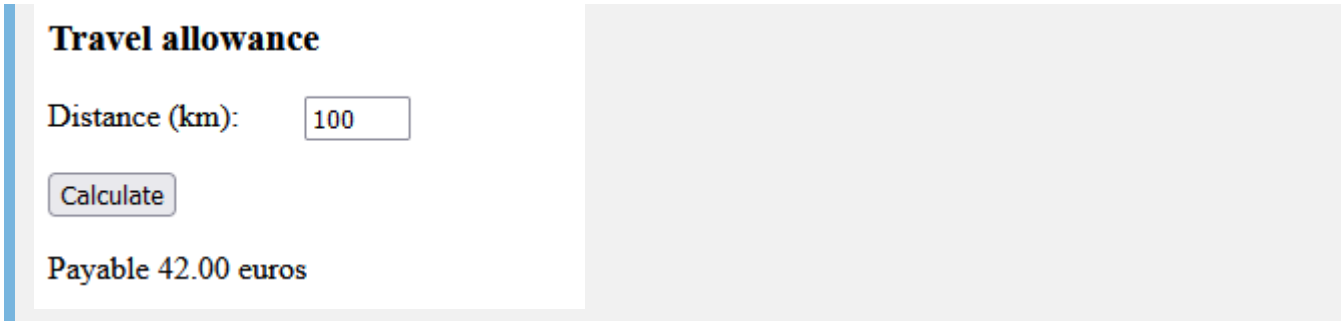
Setting up the Environment

1. Create a new working folder on your computer for this assignment.
2. Copy the files from folder `templates` to the folder.

Tasks

1. Travel allowance

Write a program that asks for the driven kilometers, calculates and displays the travel allowance. The allowance is 0.42 euros/kilometer.



The logic of the program is to write a function that will be called when the user clicks button. The idea of the function is:

```
function calculate() {
  //read the value from the kilometers field
  //calculate the kilometer compensation
  //write the answer to the HTML page
}
```

Assign the value of the input field to a variable, after turning the input text string to number:

```
var km = Number(document.getElementById("distance").value);
```

The input field on the html page looks like this:

```
<input type="text" name="distance" id="distance" size="5" />
```

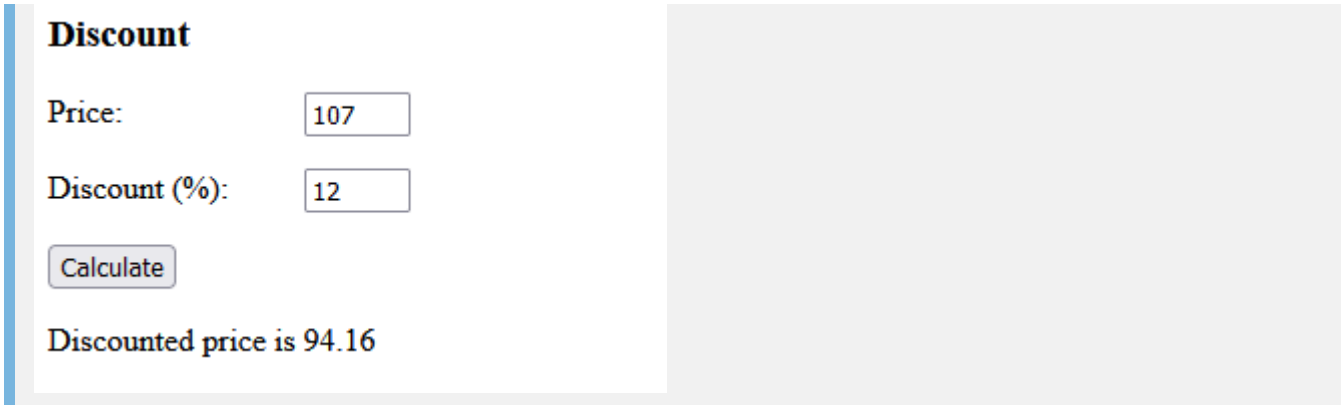
Write the answer to the HTML page (`allowance` is the variable containing the sum):

```
document.getElementById("answer").innerHTML = "Payable " + allowance.toFixed(2) +
" euros";
```

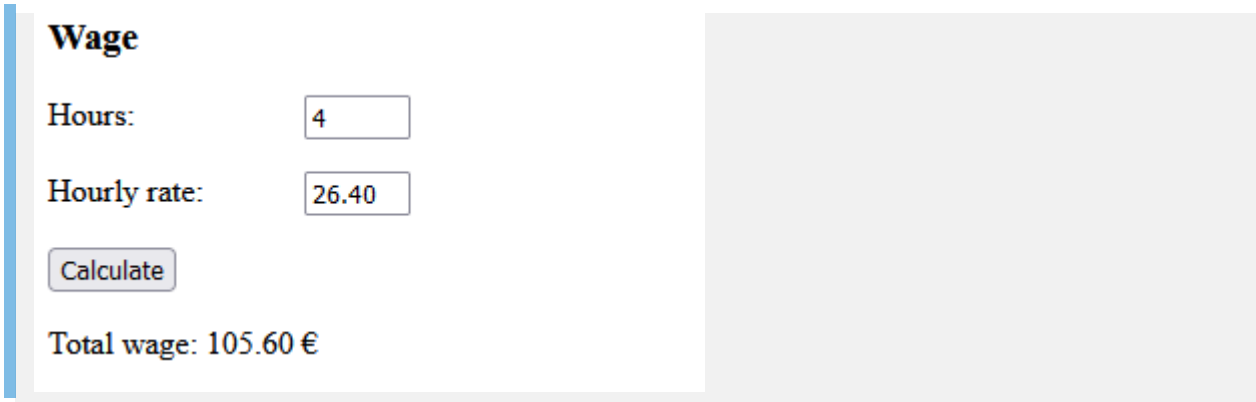
You can format the number with two decimals using the `toFixed(2)` method.

2. Discount

Write a program that calculates the discounted price of a product. The program asks for the original price of the product and the discount percentage. The program outputs the discounted price.



The discounted price is calculated: price * (100.0 - discount percentage) / 100.

3. Wage


Write a program that asks for the hours worked and the hourly wage, and calculates the total wage. The answer is formatted with two decimal places.
