WEEK 2 WARM-UP EXERCISES

JAVA SYNTAX DETAILS

1. The main method is always public. In the program class, the other methods should be **private**.
2. The keyword **void** before the name of the method means that the method does not return anything.
3. The System.out.**print** method prints output **without a line break**.
4. The **+** operator joins two strings, or a string and another type of value.
5. Create a method that returns an integer as follows:

```
private static int myMethod() {
    return 42;
}
```

6. **`int`** is the integer data type. **`int[]`** means an array of integers.
7. The following gives you the number of elements in the array: `myArray`**`.length`**

→ To insert `System.out.println()` quickly, type **syso**, then press **Ctrl+Space**

→ To format your code correctly, press **Ctrl+Shift+F**

WARM-UP EXERCISES (Not to be submitted !)

Create these programs in the ***warmup*** package in the ***Programming_1*** project.

1. Create a program named **WarmUp_6** that includes a method named **printName** that prints the text "**Warm-up 6**" to the console. The program should have a main method that calls the **printName** method.

2. Create a program **WarmUp_7** that includes a method named **printNumbers** that prints numbers from 1 up to a given maximum value on *one line*. Copy the following main method to your program:

```
public static void main(String[] args) {
    printNumbers(5);        // Prints 1 2 3 4 5
    System.out.println();
    printNumbers(10);       // Prints 1 2 3 4 5 6 7 8 9 10
}
```

3. Create a program named **WarmUp_8** that includes a method named **max** that determines and returns the maximum of two integers. Copy the following main method to your program:

```
public static void main(String[] args) {
    System.out.println(max(1, 2));    // Prints 2
    System.out.println(max(4, 1));    // Prints 4
}
```

4. Create a program named **WarmUp_9** that includes a method named **min** that finds and returns the minimum value in a given array of integers. Copy the following main method to your program:

```
public static void main(String[] args) {
    int[] a1 = { 8, 3, 4, 2 };
    int[] a2 = { 9, 8, -4, 6, -987654321, 4, 5 };

    System.out.println(min(a1));    // Prints 2
    System.out.println(min(a2));    // Prints -987654321
}
```
